In the first report of our series, we discuss the insights gained from a rare look at what shoppers really do at the point of sale, as opposed to what they say they do. The findings can help consumer goods companies determine the best strategy to grow and profit.

Executive summary

When Chinese shoppers purchase most consumer products, they typically choose among several brands instead of showing loyalty to a specific brand. Winning shoppers in this environment is both a challenge and an opportunity for marketers. Success rests on understanding actual shopper behavior—what they do at the point of sale as opposed to what they say they’ll do in surveys.

Bain & Company partnered with Kantar Worldpanel to study the shopping habits of 40,000 Chinese households. Our study helped us gain invaluable insights into how shoppers make purchases in 26 important consumer goods categories (see Figure 1).

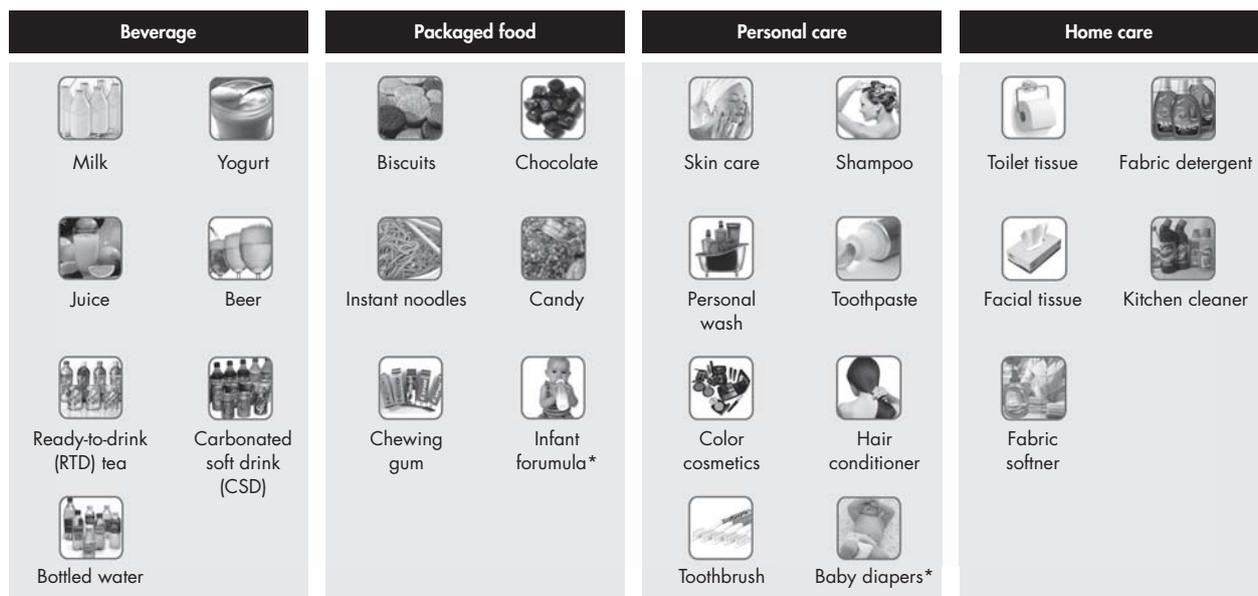

Among the key findings:

- In most situations, as shoppers buy more frequently in a category, they also tend to buy more brands in that category. We call this tendency to

choose different brands for the same occasion or need repertoire behavior (repertoire being the set of brands purchased by a consumer or shopper within a given category). Their willingness to buy a variety of brands is just as true for heavy shoppers in a category—those who are the top 20% of the most frequent purchasers in a category—as it is for average shoppers.

- It’s not a matter of brands being unimportant to these shoppers. Based on our experience working with clients in China, brand is always a major purchasing criterion. The importance of brands has been established by earlier Bain studies involving buyers in several food and non-food categories in China. In those studies, more than 60% of shoppers listed brand among the top considerations in the purchase process. But the fact is, while Chinese shoppers think about brands, our latest study found they don’t necessarily think about any single brand when they make a purchase.

Figure 1: In this report, we studied 26 consumer goods categories in mainland China

*Infant formula and baby diapers from Kantar Baby panel, 2011 H2 data only
 Note: China mainland excluding Hong Kong, Macau, Taiwan
 Sources: Kantar Worldpanel; Bain analysis

- While repertoire behavior prevails in China, there are a few product categories where shoppers are more loyal—they repeatedly buy one brand for a specific need or occasion. Those categories include infant formula, baby diapers, beer, milk, carbonated soft drinks and chewing gum. In these categories, the increase in buying frequency does not translate into purchasing more brands.
- Two factors contribute to the loyalist behavior of these shoppers. First, brand concentration: Chinese shoppers typically have a limited number of brand choices when buying beer, milk, carbonated soft drinks and chewing gum. Second, routine consumption: In categories such as milk, people who consume the product on a regular basis tend to be more loyal. Buying the brand becomes a habit. However, these more loyal shoppers are a small group, representing less than 10% of total brand sales in these categories.

Data and insights to help consumer goods players in China

Understanding category dynamics is critical for consumer goods makers racing to keep pace with surging demand for their brands by a new generation of Chinese shoppers. With China's gross domestic product growing by 10.5% annually in the past five years, the average household's disposable income rose 13.3% in the same time period to RMB 75,800 in 2011, according to Euro-monitor. With more money to spend, Chinese shoppers have catapulted China ahead of Japan to make it the world's second-largest consumer goods marketplace, following the US.

This report presents a groundbreaking look at Chinese shoppers, bringing their purchasing behaviors into sharper focus. For consumer goods makers in search of growth, the findings help fill a serious void, providing detailed data and in-depth analysis of shopper behavior—information that has been limited until now.

Our study provides much richer analysis and sharper insights into shopper behavior than traditional market research. Instead of simply asking questions about past purchases and future intentions, Kantar armed shoppers in 40,000 households with scanners that tracked their actual purchases in real time. Together, we looked at detailed records in the 26 selected consumer goods categories for 2011 and reached several important—and at times, surprising—conclusions.

This comprehensive study covers all Chinese city tiers and life stages. Shoppers from 373 cities in 20 provinces and four major municipalities participated.¹ They reflect the vast range of shopping options available in China today, from the modern trade that flourishes in Tier-1 cities (hypermarkets, supermarkets and convenience stores) to traditional trade that is common in smaller modern cities (mom-and-pop grocery shops, specialty stores and department stores). Also included in the study: China's young but burgeoning e-commerce market. We tracked older, married shoppers buying shampoo in the aisles of a Guangzhou hyper-

market and young students purchasing chewing gum in tiny mom-and-pop stores in cities like Lijiang.

The categories we analyzed span beverages, packaged foods, personal care and home care—the four largest consumer goods groups, which account for more than 80% of China's consumer goods market. And the brands we studied represent more than 50% of the market value of these four groups.

Implications

For marketers, the implications are far-reaching, providing insights that will help them shape strategic decisions. The path to winning begins by understanding the type of category in which you compete.

For brands in repertoire categories:

- **Brands are important to Chinese shoppers—even if they don't think about one brand frequently.** Winning in such an environment means that mar-

keters need to focus on important activities that support two crucial decision moments. The first is to make sure your brand is part of the shoppers' repertoire. The second is to ensure that there's enough in-store marketing to recruit shoppers each time they're selecting a brand and making a purchase.

- **Your brand's heavy shoppers are likely to be your competitors' heavy shoppers.** You shouldn't focus too much on trying to win these shoppers' loyalty because that's not how they shop in the category.
- **It's not about what shoppers think about your brand, it's about making them think about you in the first place.** Winning brands are those that are better at recruiting new shoppers day in, day out and that keep increasing the number of shoppers who buy their goods. Across categories, brand leaders—those with the highest market share—gain a competitive edge by achieving a much higher market penetration rate. (Penetration is defined as the percentage of all households within a market that are buying a particular brand.) We found that category leaders don't necessarily have a higher rate of repeat purchases or get existing shoppers to spend more on their brand. That's why they need to be present with perfect sales execution all the time, not just during a few campaigns throughout the year. The most successful brands work closely with retailers to ensure that in-store activation campaigns consistently win shoppers at each purchasing opportunity.
- **Complement "below-the-line" marketing with "above-the-line," linking your brand with specific occasions and needs.** Above-the-line marketing initiatives, such as TV commercials, are used to promote a brand or convey a specific offer. The marketing raises shopper awareness and helps them

to think about the brand when they shop for a specific occasion or need. By contrast, below-the-line marketing typically involves in-store sales promotions to create an immediate incentive to purchase.

- **Focus on building scale in priority regions.** Given that scale is required for brands to be visible throughout the year, brands need to focus first on successfully developing local or regional scale in a large and diverse market like China.
- **Asking shoppers what they want won't help you win them over.** They often don't know until they're presented with a repertoire at the point of sale. Focus your efforts on understanding their actual shopping behavior and what your competitors are doing to win them over.

For brands in loyalist categories:

- **Shoppers tend to stick to their preferred brand for a specific need or occasion,** even though they have more brand choices. So it is critical to first recruit new fans in well-defined, targeted segments. For example, infant diaper shoppers can be recruited when their new baby arrives. Next, make sure your brand is a shopper's preferred brand.
- **Devote resources to highly targeted marketing initiatives and public relations events to build brand preference.** These marketing campaigns are aimed at your loyal shoppers and include media commercials, social media, celebrity product endorsements, sports sponsorships, among others.
- **Make sure that fans can easily find your brand in the store.** But you don't need to constantly recruit them with in-store activations.

¹ Kantar Worldpanel's city tier definition is based on China's administrative definition. Beijing, Shanghai and Guangzhou are Tier-1 cities; 24 provincial capitals and a handful of prosperous prefecture cities, such as Shenzhen, Dalian, Chongqing and Qingdao, are Tier-2 cities; 228 prefecture cities are Tier-3; 322 city associated districts & county-level cities are Tier-4 cities; and 1,300 counties are Tier-5, without coverage in Inner Mongolia, Ningxia, Gansu, Qinghai, Tibet, Xinjiang and Hainan provinces. The 373 cities in the study are a representative sample of all 1,877 cities.

Full report

We know from our experience working with clients across consumer goods categories that Chinese shoppers love brands. For example, in Bain studies involving shoppers of shampoo, conditioner and body care products, brand was named among the top considerations in the purchase process by more than 60% of the shoppers studied.

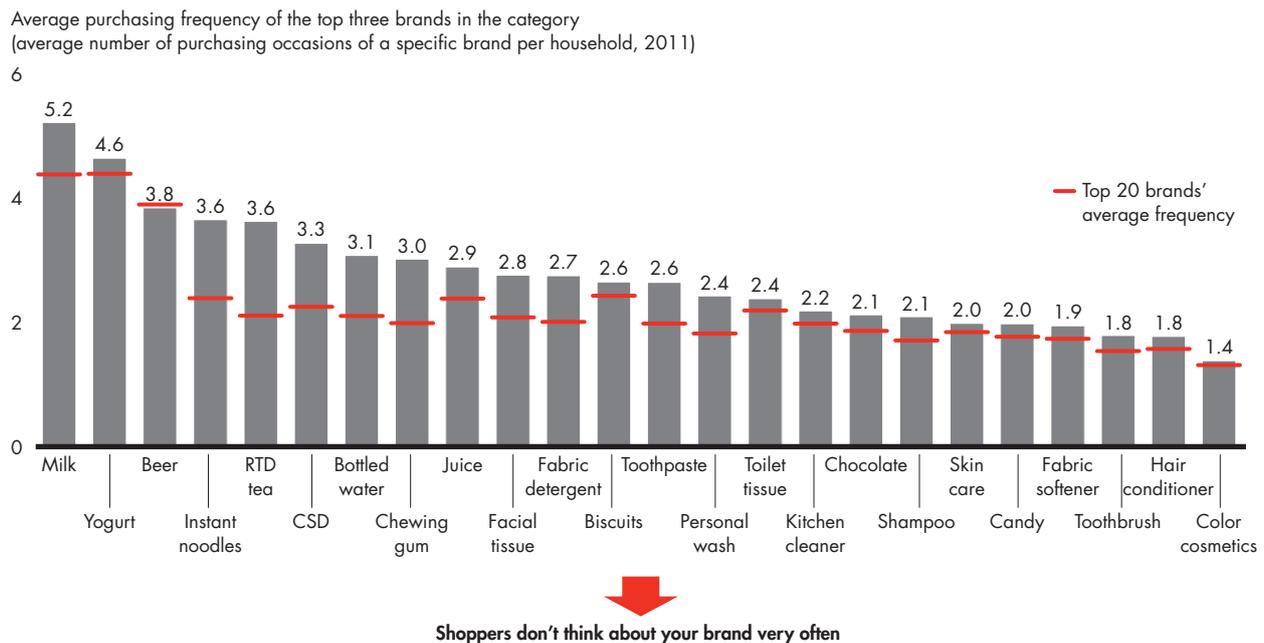

However, while brands are important, Chinese shoppers don't think about one brand very often. That was demonstrated when we looked at how frequently shoppers bought the top three brands in a category (see Figure 2). Of the 16.2 times yogurt was bought by the average Chinese household last year, shoppers chose one of the three top brands for only 4.6 of those purchases. This low purchasing frequency indicates that Chinese shoppers don't often have just one brand in mind, despite what marketers sometimes think.

Bain has been codifying shopper behavior in different consumer goods categories since 2007. Based on that experience, all shopper behavior ranges between two extreme types: loyalist and repertoire. Shoppers demonstrate loyalist behavior when they frequently buy one brand for a specific need or occasion. In contrast, shoppers exhibit repertoire behavior when they choose multiple brands within a category for the same occasion or need. Most people display a range of both loyalist and repertoire behaviors, depending on the category. Also, the same category may elicit different purchasing behaviors from one country to another. Brand strategy and activation models work best when tailored to consumer behavior.

Prevalent repertoire behavior

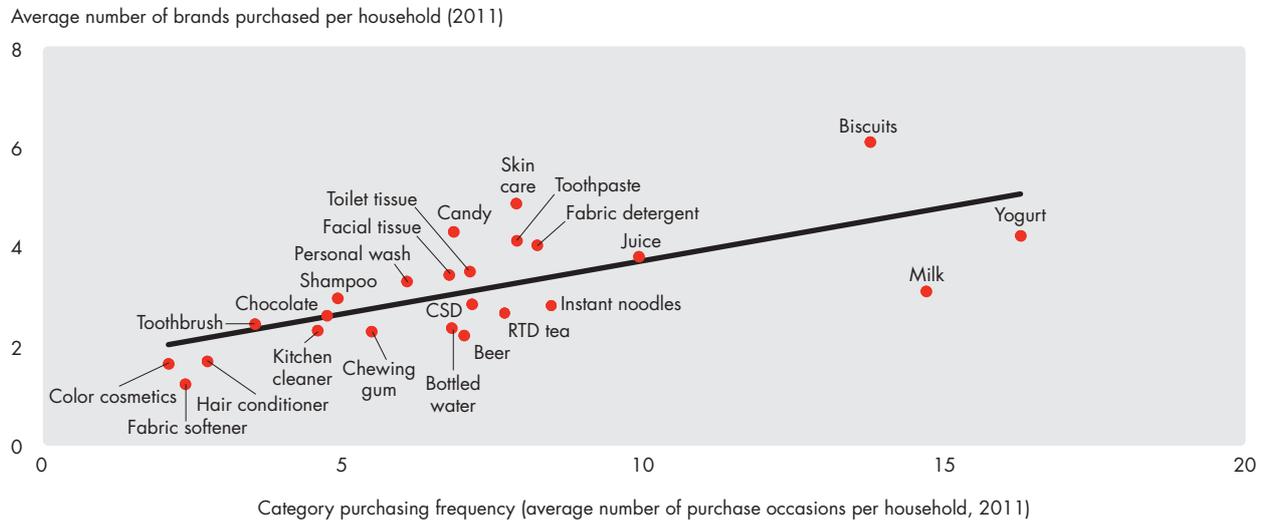

In most of the 26 consumer goods categories, we found that the vast majority of shoppers are, in fact, defined by repertoire behavior. The shoppers tend to choose more brands in the categories that they buy more frequently (see Figure 3).

Figure 2: Although Chinese shoppers love brands, they don't frequently buy just one brand

Sources: Kantar Worldpanel; Bain analysis

Figure 3: In most categories studied, Chinese shoppers tend to buy more brands as they buy more frequently in a category

Shoppers demonstrate a “repertoire” behavior in most categories

Sources: Kantar Worldpanel; Bain analysis

Another finding is that even as shoppers increase their purchasing within most categories—as they buy more juice or chocolate, for example—they use it as an opportunity to try different brands in the category (see Figures 4 and 5). The average Chinese household purchased 6.2 brands of biscuits (cookies) last year. The heavy shoppers in the category—those representing the top 20% of biscuit purchasers who buy most frequently—bought 10.4 brands.

Or take facial tissue. The average shopper bought the product 6.7 times last year, alternating between three and four brands. But heavy shoppers, who purchased facial tissues 14 times last year, chose five or six brands.

Indeed, our research suggests that in repertoire categories, a brand’s heavy shoppers are often heavy shoppers of competing brands, too.

Consider the story of Oreo, the market leader in China’s biscuit category. Since introducing Oreo to Chinese shoppers in 1996, Kraft Foods took a number of steps

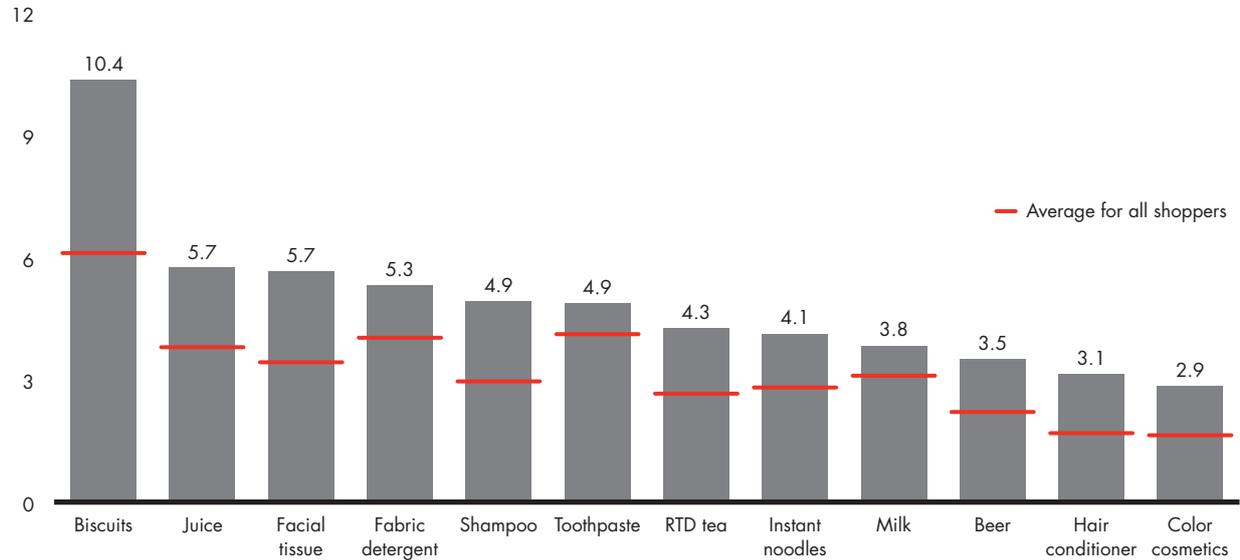

to recruit new consumers. For example, it jump-started sales by lowering the sweetness level to adapt to local tastes. It also introduced smaller packages of the original Oreo biscuits and also Mini Oreo in cups, to make Oreo more affordable to the majority of Chinese shoppers and better suited to their preference for bite-size treats. And it introduced local flavors like green tea ice cream.

To educate Chinese consumers about the American tradition of pairing cookies with milk, Kraft launched TV commercials and a grassroots marketing campaign. It recruited 300 university students to serve as Oreo brand ambassadors. By 2008 Oreo reigned as China’s top-selling biscuit, doubling its sales by 2009. Following the right approach in this typical repertoire category, Kraft focused on extending its brand penetration and did not try to push brand loyalty.

The 20% of Oreo shoppers who are the product’s most frequent purchasers in China contribute 60% of its sales value. That sounds impressive until you consider the same shoppers also contribute 25% to 35% of com-

Figure 4: Heavy shoppers buy more brands compared with average shoppers...

Figure 5: ...and they buy more brands as they purchase more frequently in most categories

Average number of brands purchased per household (2011)

Some categories, like milk and beer, skewed to "loyalist" behavior: The number of brands purchased per household doesn't increase as much as purchasing frequency increases

Note: Heavy shoppers refer to the top 20% of the most frequent shoppers in a category
Sources: Kantar Worldpanel; Bain analysis

peting brands' sales value. And these heavy shoppers of Oreo spend three-quarters of their biscuit budget on other biscuit brands (see Figure 6).

In fabric detergents, Diaopai's heavy shoppers contribute about 50% of its sales value. But these shoppers also contribute a large percentage to competing brands' sales value. And the heavy shoppers devote about 65% of their spending to other brands (see Figure 7).

How can brands benefit from heavy shoppers in a repertoire category? The smartest move is not to make your own brand's heavy shoppers the target of marketing initiatives intended to increase their loyalty. It's hard to distinguish them from category heavy shoppers—the top 20% of households that make the most frequent purchases in a category. You won't necessarily make them more loyal. Instead, go after category heavy shoppers as a group. These people are buying different brands, so there's the opportunity to attract them to your brand. Based on our experience with clients in a range of countries and across consumer goods categories,

we found that marketing focused on specific channels or occasions is often the most effective way to target category heavy shoppers.

Signs of loyalist behavior

In other categories, however, we find shoppers do not increase the number of brands they buy as their purchasing frequency increases—a sign of loyalist behavior. In infant formula and baby diapers, shoppers buy the same number of brands no matter how frequently they purchase them. A heavy shopper buys infant formula 13.4 times a year, while an average shopper makes the purchase 7.1 times. But in either case, there's little variation in the number of brands they choose—1.8 brands compared with 1.5 brands (see Figure 8).

In contrast with the repertoire categories, a brand's heavy shoppers tend to spend little on competing brands, and the brand has a high share of wallet among its heavy shoppers. (Share of wallet is the percentage of a shopper's spending that's devoted to a given brand

Figure 6: In repertoire categories, heavy shoppers of a brand are often heavy shoppers of competing brands as well

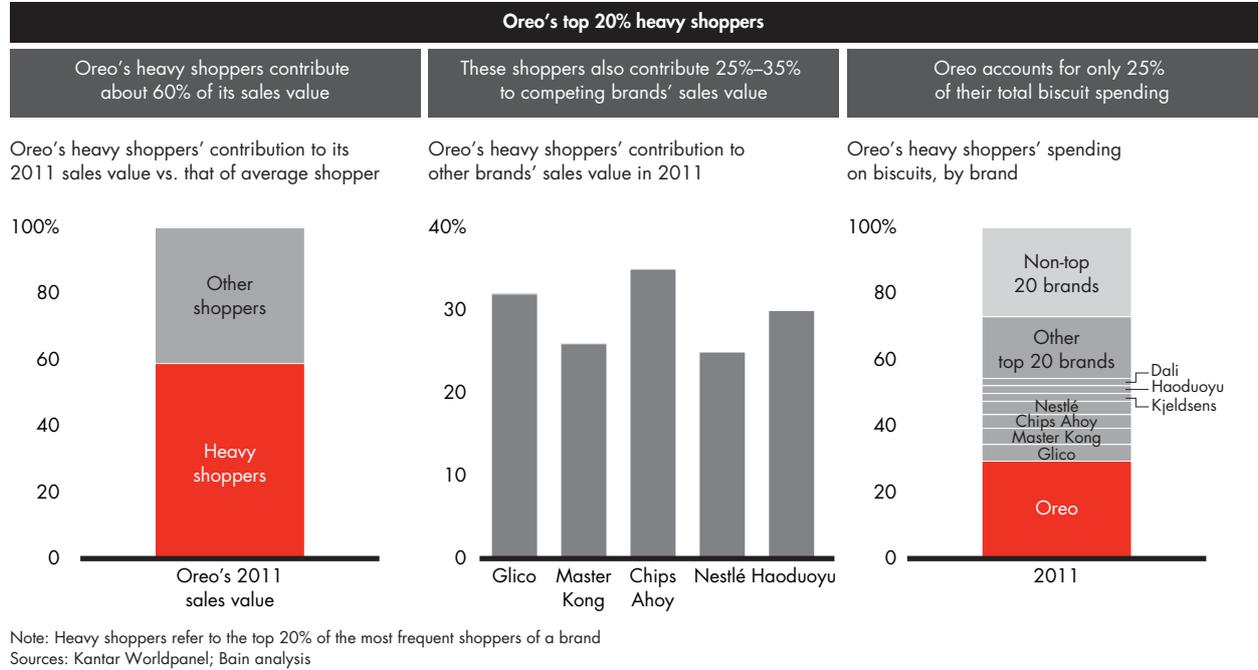

Figure 7: In repertoire categories, heavy shoppers of a brand are often heavy shoppers of competing brands as well

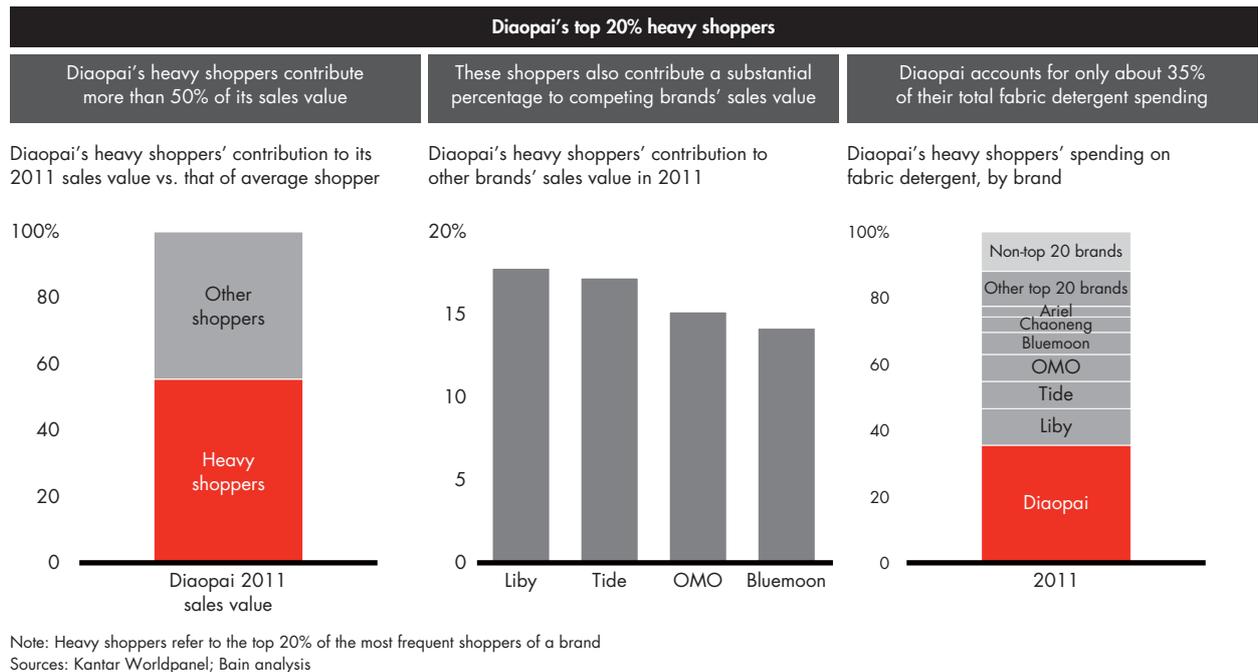

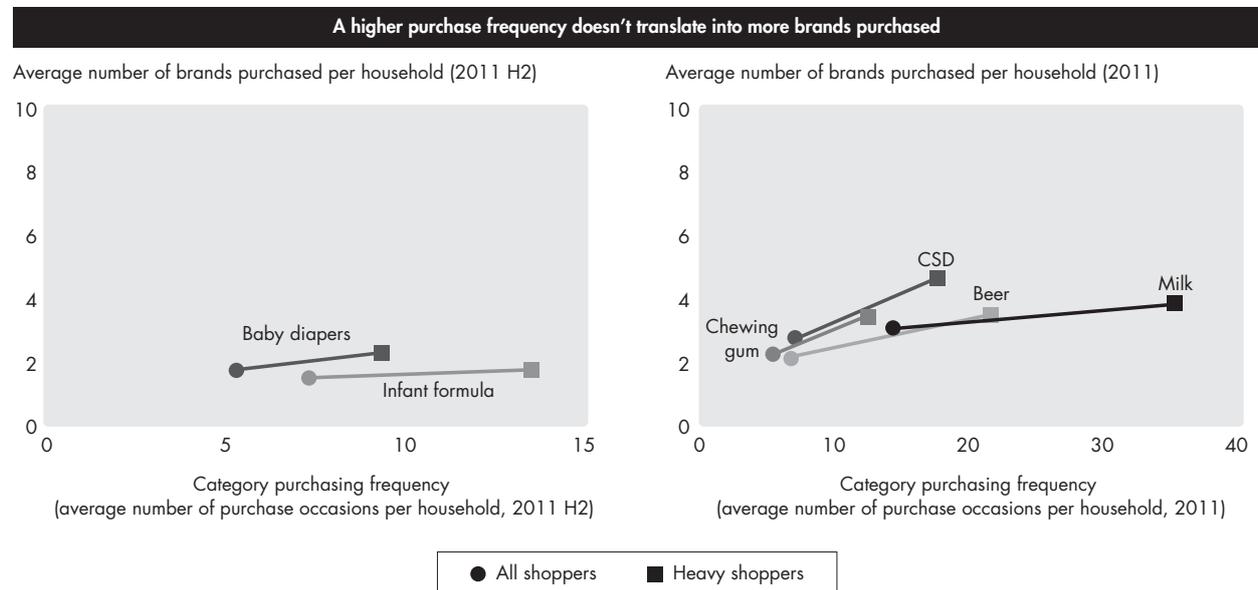

Figure 8: Shoppers in some categories show “loyalist” behavior in China

Notes: Heavy shoppers refer to the top 20% of the most frequent shoppers of a brand; Kantar Baby panel covers 2,000 households with a baby younger than 3 in Tier-1 and Tier-2 cities
Sources: Kantar Worldpanel; Bain analysis

within a category.) Consider the infant formula segment. The top 20% of Mead Johnson’s heavy shoppers account for 40% of the brand’s sales but contribute at most 10% to competitors’ sales. And Mead Johnson claims a significant share of those shoppers’ wallets. Those heavy shoppers devote 85% of their infant formula spending to Mead Johnson (see Figure 9). The situation is similar with Pampers in baby diapers. More than 50% of Pampers’s sales come from heavy shoppers, and those shoppers contribute less than 6% to any one competitor. And Pampers earns a high share of wallet from these heavy shoppers—a full 80% (see Figure 10).

One Bain study of shoppers of infant products found that they don’t have motivation to switch brands. The babies aren’t providing feedback on the benefits or drawbacks to the product, so shoppers have little reason to change one brand for another. Also, studies have shown that mothers feel it’s beneficial to a baby’s health to stick with a single brand. And this is one situ-

ation in which shoppers often are introduced to a particular brand in the hospital or clinic at the critical moments following a child’s birth—and they tend to stay loyal to that brand. That is why leading infant formula players have medical detailing teams visiting hospitals, nurses and pediatricians, in addition to their salesforce visiting other sales channels.

Four other categories show signs of loyalist behavior: milk, beer, chewing gum and carbonated soft drinks. Unlike most other categories, where shoppers try more brands as they buy more frequently, heavy shoppers in these loyalist categories don’t increase the number of brands they purchase as they increase their rate of purchase. As their consumption becomes routine, they tend to stick to one preferred brand—which gets more of their share of wallet. And these shoppers tend to spend less on competing brands.

We also see loyalist behavior in categories and geographies that are highly concentrated, where the top three

Figure 9: In loyalist categories, a brand's heavy shoppers contribute very little to competing brands' sales

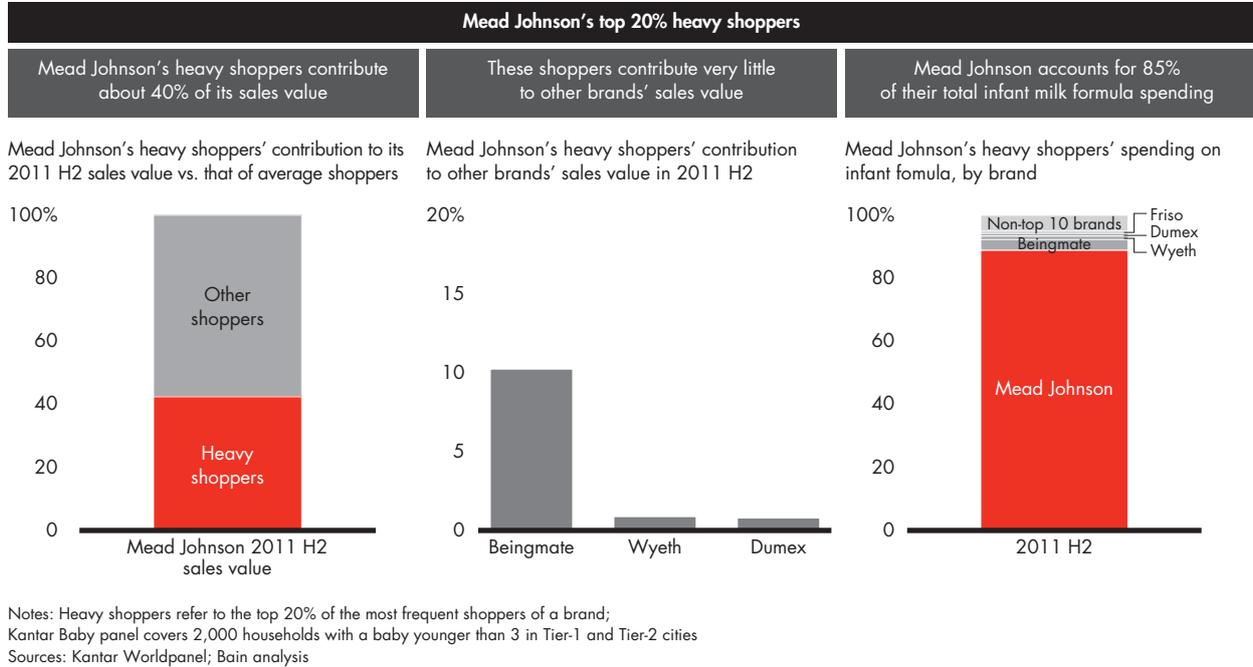

Figure 10: In loyalist categories, a brand's heavy shoppers contribute very little to competing brands' sales

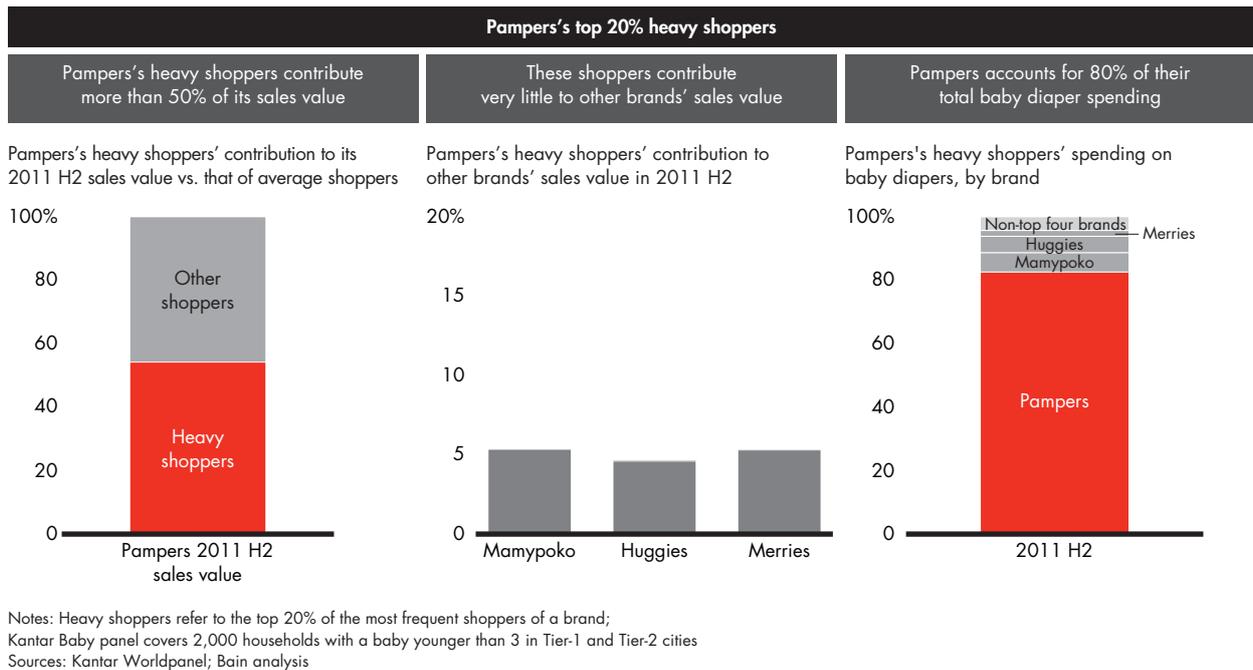

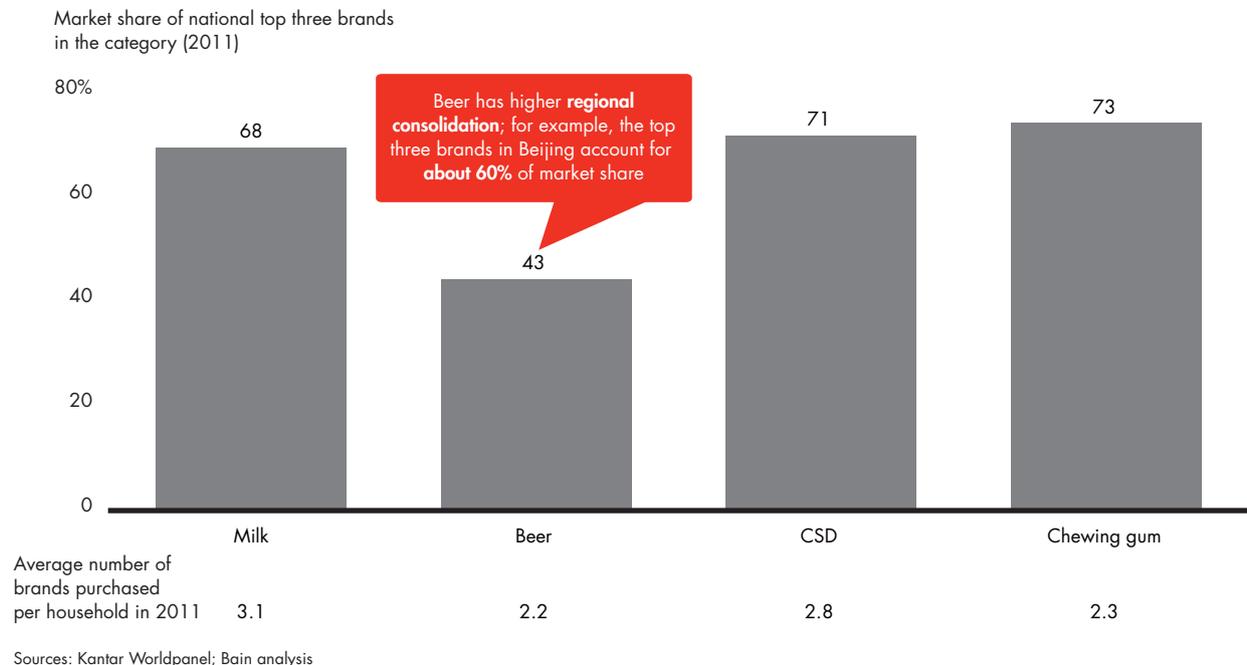

Figure 11: The loyalist behavior may also be driven by a high level of brand concentration in some categories

brands account for the overwhelming majority of category sales (see *Figure 11*). Because there are so few players, shoppers are more likely to repeatedly choose the same brand. They are, in effect, forced to be loyal. For example, beer is a category with a particularly high degree of regional consolidation in China, with the top three brands accounting for up to 60% of off-premise sales in a region. That dynamic is reflected in the number of brands shoppers choose. The average household purchased 2.2 brands of beer in 2011 in off-premise channels, which is less than the three brands purchased, on average, across all loyalist categories.

There's another important factor limiting brand options: traditional trade. Traditional trade accounts for more than half of all beer sales volume in off-premise channels in Tier-2 to Tier-5 cities. Given the limited shelf space in mom-and-pop stores, traditional trade outlets often stock only two brands of beer—compared with six or more brands sold in a modern trade outlet. Therefore, the shoppers sometimes are forced to choose the same brand repeatedly, because it's the only option they have.

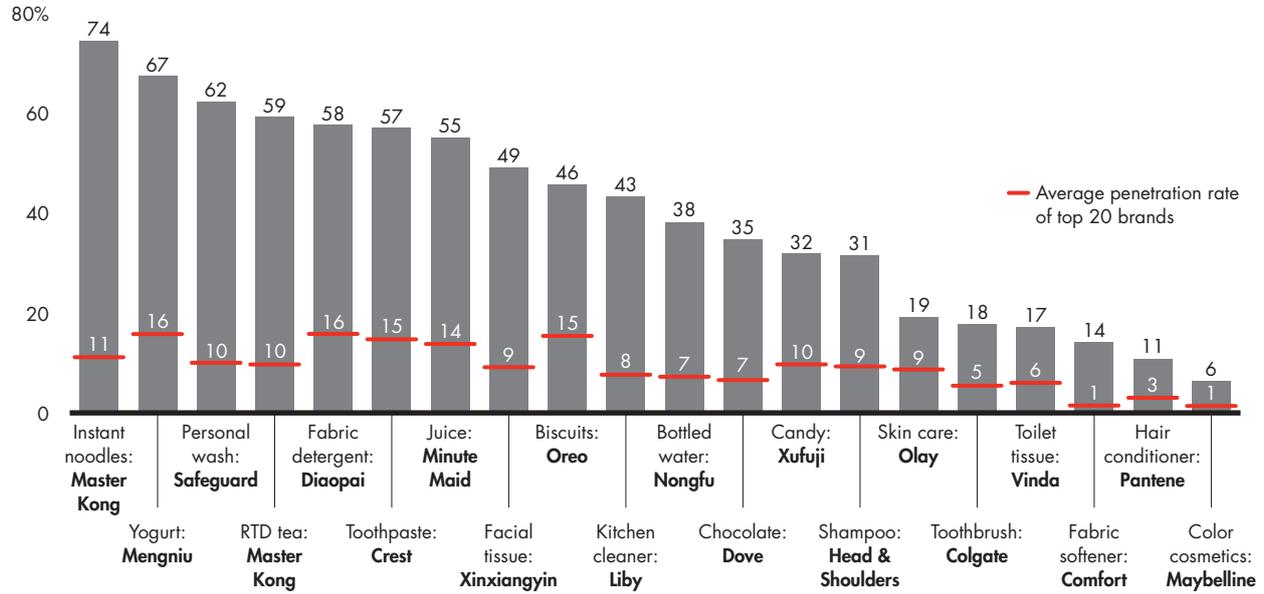

What brands are doing to win

When we analyzed the leading brands in each of the repertoire categories, we found that winners have one critical thing in common: high rates of penetration compared with the average of the top 20 brands in their category (see *Figure 12*).

In toothpaste, Crest is the brand with the highest penetration rate—57% compared with the average of 15% for the category's top 20 brands. Not surprisingly, it's also the category leader, with 15% market share. Like leading brands in other categories, Oreo maintains the highest penetration rate among any biscuit player. Its penetration rate of 46% is nearly three times the national average for the top 20 brands, and its market share of 10% is higher than that of its competitors. Master Kong has a 29% penetration rate and 4% market share. Nestlé maintains a 16% penetration rate and 3% market share, although its penetration rate is higher in Tier-1 cities. Penetration and purchasing frequency often work hand in hand (see *Figure 13*). Just as it

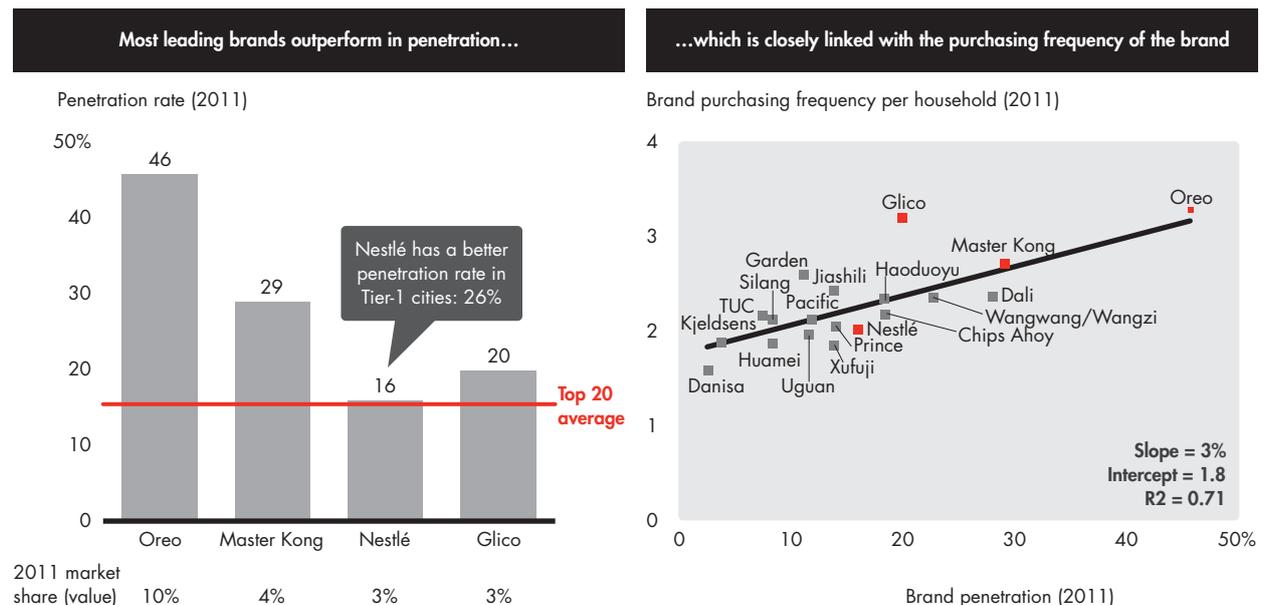

Figure 12: In the “repertoire” environment, leading brands have a much higher penetration than competing brands

Penetration rate: leading brand vs. average of top 20 brands in each category (2011)

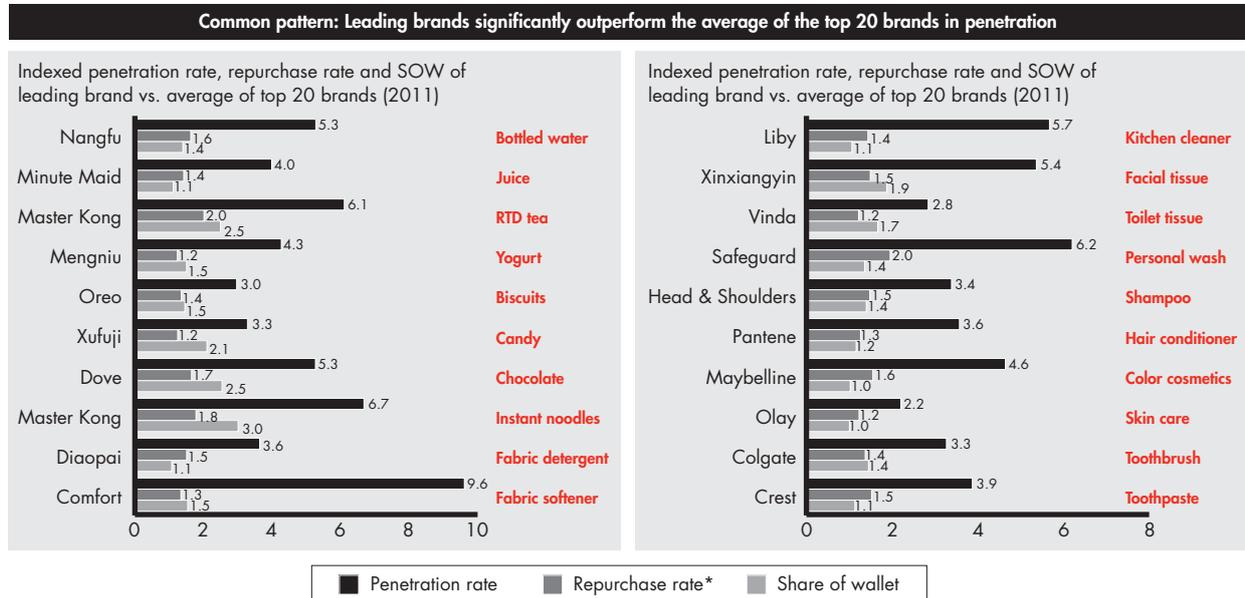

Sources: Kantar Worldpanel; Bain analysis

Figure 13: Leading brands achieved substantially higher penetration, driving brand purchasing frequency

Notes: Right-hand side includes brands with national market share (value) of more than 1%; Glico is an outlier
Sources: Kantar Worldpanel; Bain analysis

Figure 14: However, leading brands don't necessarily have much higher repurchase rates or share of wallet (SOW) than competing brands

*Repurchase rate refers to shoppers who buy more than once a year as a percentage of all brand shoppers
 Note: Indexed penetration of Nongfu in bottled water, for example, equals Nongfu's penetration rate divide by the average penetration rate of the top 20 brands
 Sources: Kantar Worldpanel; Bain analysis

leads in penetration and market share, Oreo has the highest rate of repurchasing frequency. The brand was repurchased 3.3 times per household in 2011 compared with 2.7 times for Master Kong and two times for Nestlé.

In these categories, success for leading companies has more to do with penetration than other factors, such as whether shoppers make repeat purchases of the brand more than once a year (see Figure 14). In fact, even for the leading brand in each category, more than 40% of brand shoppers are still trial shoppers—they bought the top brand only once last year. Looking at fabric detergents, brand leader Diaopai's repeat purchase rate of 64% is not significantly higher than followers like OMO (55%) and Bluemoon (46%). And in toothpaste, the rate of repeat purchases for the leader, Crest (58%), is not much higher than that of followers like Darlie (52%) and Colgate (51%).

Another factor that is less important than penetration is share of wallet among a brand's shoppers (see Figure 14). Our study found that some leading brands achieved only an average share of wallet. Look at Diaopai's share among fabric detergent shoppers: It's actually lower than that of Liby, OMO or Bluemoon—all of which are market share followers. In toothpaste, leader Crest's share of wallet is actually significantly lower than that of Darlie and not much above the industry average.

And we found that as they increase penetration, leaders focus on the right product format, city tiers and channels. For example, Bluemoon sells only liquid laundry detergent and has been able to target its penetration efforts on Tier-1 and Tier-2 cities, where shoppers prefer the liquid form. Diaopai focuses on laundry powder and laundry bars, striving to build up its high rate of penetration in Tier-2 to Tier-5 cities, where powder and bars are still popular.

Rules of the road

Whether a brand is a leader or a follower in its category, gaining market share and sustaining growth in China means following some clear rules.²

In repertoire categories:

- **Make sure your brand is part of shoppers' repertoire, and then recruit them when they purchase through in-store activation, day in and day out.** For leading brands, remember that while your brand might already be in many shoppers' repertoire, it doesn't mean those shoppers will choose you again next time they buy. Invest to recruit them in the store, just as you would recruit any new shopper—otherwise you risk losing the shoppers to other brands in their repertoire. For followers, the good news is that Chinese shoppers exhibit repertoire behavior in most categories; this makes it possible to win shoppers from competitors. The key is to drive penetration through effective in-store activation in targeted channels.
- **Build brand awareness by using "above-the-line" marketing initiatives, like TV commercials, that complement "below-the-line" efforts.** This will get shoppers to think about your brand when they shop for a specific occasion or need.
- **Don't focus too much on trying to make shoppers loyal to your brand.** It's not about how they shop in the category. The reality is that one brand's heavy shoppers are likely to be a competitor's heavy shoppers, too. Focus on in-store activation with perfect sales execution in the target channels, where you will find the category's heavy shoppers.
- **Build scale in priority regions first.** China is undeniably big, and successful companies don't view it as a single market. If scale is required for year-round visibility, the most cost-effective approach is to target a locality or region—and then move on to the next one with a winning repeatable model. Neither multi-

nationals nor local players can hope to go national without first building local scale.

- **Instead of asking shoppers what they want, invest to understand their actual shopping behavior.** For market followers, it's also a good way to see what the leading brands are doing to recruit shoppers.

In loyalist categories:

- **Recruit new shoppers in well-defined segments where you're likely to find and attract shoppers who will stick to a preferred brand for a specific need or occasion.** For both leaders and followers, the most critical move is to find a well-defined shopper segment and encourage them to try your brand first. Pampers, the leading brand in baby diapers, provides free trial packages of diapers to new mothers when they give birth in a hospital. The first trial is the foundation for building brand preference.
- **Build brand preference through highly targeted marketing initiatives and public relations events.** Leading brands in the loyalist categories continuously invest to build brand preference. They put special emphasis on specific switching points, investing to reduce churn.
- **Make it easy for shoppers to find your brand in the store.** But it's not necessary to constantly motivate them with in-store activations. Leading brands invest heavily to ensure their products are in stock, on the right shelf and attractively displayed.

As demand for everything from fabric softener to hair conditioner to chewing gum increases at a record pace in China, you can develop a strategy that will help you serve that demand—and profit. Understanding the critical nuances of shopper behavior at the point of sale arms you with the ammunition needed to outpace the competition. These findings from our extensive study on China's shopper behavior—a groundbreaking look—are valuable to any consumer goods company executive searching for the best way to grow and prosper along with China's economy.

² For more information on Bain's approach to brand building, see the Bain brief "Introducing The Bain Brand AcceleratorSM," published in 2011.

Acknowledgments

This report is a joint effort between Bain & Company and Kantar Worldpanel. The authors extend gratitude to all who contributed to this report, in particular Hongfei Zheng, Victoria Lan, Iris Zhou and Jixuan Jiang from Bain & Company; Rachel Lee, Tina Qin and Tracy Zhuang from Kantar Worldpanel.

We will continue our study of Chinese shoppers in follow-up reports, each of which will focus on a different and complementary topic. We will address such topics as

- What does this research mean for retailers?
- Are there differences in shoppers' behaviors across city tiers, regions and category types?
- What are the implications for multinational companies and local firms across categories?

Shared Ambition, True Results

Bain & Company is the management consulting firm that the world's business leaders come to when they want results.

Bain advises clients on strategy, operations, technology, organization, private equity and mergers and acquisitions. We develop practical, customized insights that clients act on and transfer skills that make change stick. Founded in 1973, Bain has 48 offices in 31 countries, and our deep expertise and client roster cross every industry and economic sector. Our clients have outperformed the stock market 4 to 1.

What sets us apart

We believe a consulting firm should be more than an adviser. So we put ourselves in our clients' shoes, selling outcomes, not projects. We align our incentives with our clients by linking our fees to their results and collaborate to unlock the full potential of their business. Our Results Delivery® process builds our clients' capabilities, and our True North values mean we do the right thing for our clients, people and communities—always.

Bain in Greater China

Bain was the first strategic consulting firm to set up an office in Beijing in 1993. Since then Bain has worked with both multinationals and local clients across more than 30 industries. We have served our clients in more than 40 cities in China. There are now three offices in the Greater China region, covering Beijing, Shanghai and Hong Kong. There are about 150 consultants currently working in Greater China, with extensive Chinese and global working experiences.

Kantar Worldpanel—high definition inspiration™, a CTR service in China

Kantar Worldpanel is the world leader in continuous consumer panels. Our global team of consultants apply tailored research solutions and advanced analytics to bring you unrivaled sharpness and clarity of insight to both the big picture and the fine detail. We help our clients understand what people buy, what they use and the attitudes behind shopper and consumer behavior.

We use the latest data collection technologies best matched to the people and the environment we are measuring. Our expertise is rooted in hard, quantitative evidence—evidence that has become the market currency for local and multinational FMCG brand and private label manufacturers, fresh food suppliers, retailers, market analysts and government organizations. We are not limited to the grocery sector; we have a wide range of panels in fields as diverse as entertainment, communications, petrol, fashion, personal care, beauty, baby and food-on-the-go.

It's what we do with our data that sets us apart. We apply hindsight, insight, foresight and advice to make a real difference to the way you see your world and inspire the actions you take for a more successful business.

We have over 40 years experience in helping companies shape their strategies and manage their tactical decisions; we understand shopper and retailer dynamics; we explore opportunities for growth in terms of products, categories, regions and within trade environments. Together with our partner relationships, we are present in more than 50 countries—in most of which we are market leaders—which means we can deliver inspiring insights on a local, regional and global scale. Kantar Worldpanel was formerly known as TNS Worldpanel.
